

Title

Reverse a string

Background Context

Reverse a string

Program Specifications

Create a program allows user input a string from keyboard and then reverse that string.

Function details:

1. Enter a string, each word is separated by underscore or space.
2. Reverse the string, keep status of all characters (lower case, upper case, ...).
3. Display to the screen the original string and the reversed string.
4. The program continues to do another reverse task if user press enter key, exit is press Esc.

Expectation of User interface:

The Program must have interface as below:

Please enter string: My_String Input

The old string: My_String Input

The reversed string: Input String_My

Press enter to continue another reverse, ESC to exit
